NRV

Remember Your RVs

Privacy & Data Notice

Last updated Nov 8, 2026

At a glance

Before first use, NRV presents the Terms of Use and Privacy & Data Notice with one checkbox. By checking it, you agree to the Terms of Use and acknowledge this Privacy & Data Notice. This interaction does not connect Dropbox, share a contact, or run an address search.

NRV stores records locally without an NRV account or central contact database. App passphrase protection and Dropbox backup/sync are optional. Browser and Home Screen storage sharing varies by platform. Backup and export protection depends on the file type, as explained below.

Website and app use, update checks, maps, address lookups, navigation, sharing, and optional Dropbox connections can involve external requests. The later sections explain what these features do and distinguish local data from backups and exported copies.

Information stored on your device

NRV stores contact and visit information you enter, including names, email addresses, phone numbers, Country, State/Province, City, Region, Area, street address, map coordinates, and visit notes. It also stores app settings and optional Time in Service data in browser IndexedDB storage. When app passphrase protection is enabled, saved contacts and the settings record are encrypted. That settings record includes Time in Service entries, notes, data used to calculate totals, and timer start time. Without protection, those records are unencrypted, and someone with access to the device and browser profile may be able to read them. NRV decrypts protected records in the browser while you use them. Some timer/activity metadata remains unencrypted in local storage; it is not recorded hours or notes. The Dropbox connection token is stored separately in localStorage and is not protected by app-data encryption.

Whether browser and installed/Home Screen instances share local storage depends on the platform. The current website and /app/ share the nicereturnvisits.org origin. Browser storage is origin-based, so IndexedDB and localStorage are not separated merely by URL path. The legacy GitHub Pages deployment uses a separate origin. Data is sent to Dropbox only if you choose to connect optional Dropbox cloud backup. When connected, NRV can upload backups, check for newer Dropbox data, download compatible backup data, combine supported local and Dropbox changes in the browser, and upload the combined result. NRV code does not create an application user account or central contact database.

For regular phone use, I recommend adding NRV to your Home Screen; it opens like an app while keeping contacts locally on your device. Whether the browser and Home Screen instances share storage depends on the platform; adding the icon does not establish whether they share data. If the instances use separate storage, contacts do not automatically transfer or sync between them unless compatible optional Dropbox backup and sync is connected in both storage contexts. To switch using a full backup, export it from the instance with your data and restore it in the destination instance, then verify the result. Full backups use the active app passphrase when protection is enabled and are unencrypted otherwise. See the Help page.

You can turn on, change, or turn off the app passphrase in Settings (entering the existing passphrase when changing or turning off one). NRV re-encrypts or decrypts saved contacts and settings in the current storage context locally. This does not itself change data in other storage contexts or existing exported files. Existing encrypted full backups retain their original protection and can be unlocked with the passphrase used to create them or a recovery code. Existing unencrypted files remain unencrypted. Individual contact-transfer files use a separate file passphrase when protection is enabled; a recovery code cannot unlock those encrypted files.

Information sent to other services

The features below use external providers for specific purposes: Nominatim for location lookups, OpenStreetMap tile servers for map display, unpkg.com for mapping software, Google Maps for navigation, your chosen service or operating-system composer for sharing, and Dropbox for optional backups and sync. NRV's app-level statements do not establish those providers' practices. Consult their current terms and privacy information when deciding whether to use a feature.

If no contact, home, or live-location pin is available, the Default City, State/Province, and Country may also be sent to Nominatim to center the map approximately. Entering or saving contact details does not by itself run the contact-address search. Find from address in Settings → Defaults & Your Details sends that address to Nominatim. If the home-address lookup finds no result, NRV can also send the configured Default City, State/Province, and Country to Nominatim as a fallback. With permission, the Map uses device location while it is open to show your live position as a blue dot. NRV itself does not record audio; keyboard dictation is handled by your device. Map images and mapping software are loaded from external providers.

- **Address search:** If you choose Find Address or City Pin, NRV sends location search text to OpenStreetMap Nominatim. Depending on what you entered, this can include street address, City, State/Province, and Country. It may also search the street name without its leading house number. Search Near Cross-Street sends the intersection with the selected location. When the Map opens, visible contacts without saved coordinates can cause distinct City, State/Province, and Country combinations to be sent to Nominatim for approximate city pins. If there are no contact, home, or live-location pins, the Default City, State/Province, and Country may be sent to Nominatim to center the map approximately. If a home-address lookup finds no result, NRV can also look up the configured Default City, State/Province, and Country as a fallback.
- Entering or saving contact details does not by itself run the contact-address search. Opening the Map can run the city lookups described above.
- Do not use these lookup features or the Map if you do not want the relevant location information sent to Nominatim.
- **Navigation:** If you choose Navigate on a contact card or map pin, NRV opens Google Maps directions using the contact's saved coordinates or address. That destination is sent to Google Maps. Do not use the navigation link if you do not want that location information sent to Google.
- **Contact sharing:** If you choose Share and select Text / SMS, WhatsApp, or Email, NRV prepares a plain-text summary of the contact's name and available phone, email, address, and directions link. It can optionally include "Shared by" followed by your profile name. Visit notes are included only if you choose the most recent note or all notes in the Share dialog; the default is none. NRV opens WhatsApp through a link containing the prepared text. SMS and email receive prefilled content through their applicable app or operating-system handoff. NRV does not itself send the message; sending requires your action. These handoffs do not establish what a receiving service records or processes. This plain-text sharing option is not encrypted by NRV; individual contact-

transfer files use the separate protection described below.

- **Map display:** When you open or use a map, your browser requests map tiles from OpenStreetMap tile servers. Those requests reveal the map areas being viewed and may reveal ordinary connection information, such as your device's IP address, to the tile provider.
- **Mapping software:** The Leaflet mapping library is loaded from unpkg.com. Your browser connects to that provider to retrieve the library used to display the map.
- **Hosting:** The current NRV website and app at https://nicereturnvisits.org/app/ are operational through Hostinger/HCDN. Opening or using the website or app involves browser requests to that infrastructure. The legacy GitHub Pages app remains publicly reachable at a separate origin; it is not the current NRV deployment and has not been removed or redirected. Locally stored data at that legacy origin does not automatically transfer to the current NRV origin. Provider-side logging, analytics, retention, and operator access have not been verified.
- **Update/version checks:** While online, NRV checks its same-origin service worker for updates at startup. A manual update check also requests version.json from the same origin. NRV does not deliberately include contact data, account identity, or a device identifier in these requests. Ordinary network information, such as your IP address and browser-supplied request information, may be available to hosting or network providers. This does not establish what providers log or how long they retain information.
- **Device location:** If you choose Use Device Location and grant permission, the browser asks the device for its current location and can use the returned coordinates to position a contact or home pin. When you open the Map and grant permission, NRV can also watch device location while the Map is open and show current position as a blue dot with an accuracy area. Location accuracy can vary.
- **Dropbox (optional):** Only if you connect Dropbox in Settings, your browser contacts Dropbox to sign in and uses the Return Visits app folder in your Dropbox account. It can upload backups, check for and download newer copies, combine compatible local and cloud changes in the browser, and upload the combined result. Merge compatibility depends on encryption metadata, including salts; matching passphrases alone do not guarantee compatibility. An encryption-metadata mismatch can prevent automatic combining and pause automatic backup until you decide whether to restore the Dropbox backup locally or replace it with a backup of the local data.

NRV does not include analytics, advertising, registration, or an in-app user-tracking feature. Through the app itself, I do not collect or maintain information identifying who downloads, visits, or uses NRV, or how they use it. This app-level statement does not establish the practices of hosting or other external providers.

Because users are not required to register or sign in and I do not receive user-identifying or usage reports through NRV, I cannot verify an end-user’s identity, location, age, eligibility, or intended use of NRV. This describes the app’s collection behavior, not verified hosting-provider practices. Provider logging, analytics, retention, and operator access have not been established by this verification. Consult the providers’ current terms and privacy notices. Provider-side logging, analytics, retention, and operator access have not been verified.

Backups, exports, printing, and sharing

- Local full backups and exports are created when you choose the relevant export action. Full backups include Time in Service settings and use the active app passphrase when protection is enabled; otherwise they are unencrypted. Contact-list exports can be saved unencrypted even when app protection is enabled. Individual contact-transfer files use a separate file passphrase when protection is enabled. A recovery code can unlock an encrypted full backup, but not an encrypted contact-transfer file. To enable optional Dropbox cloud backup and sync, connect your Dropbox account in NRV’s Settings and authorize NRV to use its Return Visits app folder. Simply having or using Dropbox does not enable this feature. After connection and authorization, provided automatic backup is not paused by an encryption-metadata mismatch, NRV automatically uploads

the latest backup about 15 seconds after a saved change and tries to upload any pending backup when you leave or hide the app. When you open NRV, it also backs up if the last Dropbox backup was at least a day ago, subject to the same pause condition. Backup and syncing cannot continue while NRV is completely closed. A connection is needed in each storage context used; whether browser and Home Screen instances share that context depends on the platform.

- **Dropbox cloud backup (optional, off by default):** If you connect your Dropbox account in Settings, NRV uploads full backups to its Return Visits app folder in Dropbox, maintaining latest.json plus up to 10 timestamped snapshots. Forced or manual snapshots can create more than one snapshot in a day; these are not necessarily daily copies. Full backups use the active app passphrase when protection is enabled; otherwise they are unencrypted. Compatible newer Dropbox data can be downloaded and merged locally before a combined copy is uploaded. Compatibility depends on encryption metadata, including salts, not just matching passphrases. NRV stores the Dropbox access token separately in localStorage; it is not protected by the passphrase encryption used for app data. Disconnecting attempts to revoke the token and then removes the local token even if revocation fails. Dropbox's own terms and privacy policy apply to files in your Dropbox account. I do not receive your Dropbox credentials or your backups.
- You choose where to save, store, or share exported files. Anyone who obtains an unencrypted full backup or contact-list export can read it, even if app protection is enabled. An encrypted full backup can be unlocked with its app passphrase or recovery code. An encrypted individual contact-transfer file requires its separate file passphrase; a recovery code cannot unlock it. Keep passphrases and recovery codes private and separate from the files they protect.
- Restoring a full backup replaces the local contacts and settings on the device after confirmation.
- If you print or save a printout as a PDF, contact information is sent to the printer or PDF destination you select through your device or browser. Protect printed pages and saved PDFs as you would other contact records.

Security limitations

The protections described in this notice do not guarantee complete security of browser or device storage, backups, exported files, or electronic transmission. Protect your devices and saved copies, and keep passphrases and recovery codes private.

Your choices and responsibilities

- You can choose whether to use address lookup, device location, maps, exports, and printing. Map tiles and address lookup require an internet connection.
- If you turn on protection, keep your app passphrase, recovery code, and any separate contact-transfer file passphrases private. Make backups regularly. A recovery code can unlock an encrypted full backup, but cannot unlock an encrypted contact-transfer file. Do not rely on it to recover a contact-transfer file passphrase.
- If you clear browser storage, remove NRV, lose the device, or forget a passphrase you turned on without a usable backup, your local records may become unavailable.
- You are responsible for entering contact information appropriately and for deciding whether you have permission to store, export, print, or share it.

Retention and deletion

Records stored at the legacy GitHub Pages app's separate origin do not automatically transfer to the current app at https://nicereturnvisits.org/app/. Before switching, make a full backup and restore it to the current app. Verify that your contacts and settings are present, and retain the legacy copy and backup until verification is complete.

Local NRV data. Delete contact records in NRV or use the relevant browser site-data controls. Erase All Data deletes the NRV IndexedDB database and clears localStorage and sessionStorage for the NRV origin, including the locally stored Dropbox connection token. It does not revoke that token, delete Dropbox backup files, clear service-worker caches, unregister the service worker, or delete downloaded/exported files. The current website and /app/ share the nicereturnvisits.org origin; browser storage is origin-based, not separated merely by URL path.

Dropbox backups. Erasing local NRV data does not delete files in Dropbox. Delete those backups separately in your Dropbox account.

Downloaded and exported copies. Erasing local data does not remove downloaded backups, contact-list exports, individual contact-transfer files, printed pages, or saved PDFs. Remove these separately wherever you saved or shared them.

Legacy-origin data. Clearing data for nicereturnvisits.org does not clear data stored under the legacy app's different origin. Remove legacy-origin data separately if required.

Browser and device differences. Whether browser and installed/Home Screen instances share storage varies by platform. What uninstalling, reinstalling, or platform-level clearing removes also varies; do not assume these actions erase every local copy or cache. Browser storage may be cleared under storage pressure or when a private-browsing session ends; exact behavior requires platform testing. Use the relevant browser or device site-data controls and verify what remains on every browser and device used. Menu names and deletion behavior vary by platform and version.

Privacy questions and contact

For privacy questions about NRV, contact Reachout@nrvisits.org.

Changes and what I can know

I do not collect user-identifying information or receive usage reports through NRV, so I cannot identify individual users or verify who they are or any details about them through the app. I update this notice if NRV's storage, network connections, providers, or features change. These app-level statements do not establish hosting or other providers' logging, analytics, retention, or operator-access practices.
